Successfully created load balancer: Enterprise-ALB
It might take a few minutes for your load balancer to fully set up and route traffic. Targets will also take a few minutes to complete the registration process and pass initial health checks.

Due to permissions limitations in the AWS sandbox environment (Whiz Labs), I was unable to create an RDS instance. However, I designed the architecture with an RDS-ready configuration including a dedicated RDS-SG and private subnet placement. In a real production environment, I would deploy RDS with the exact same security settings. The Security Group (RDS-SG) is already configured to allow MySQL traffic only from Web-SG, and the RDS would be deployed in a private subnet with public access disabled as shown in the architecture diagram.
